EXECUTIVE SUMMARY

The following document details the emissions to air monitoring survey undertaken by Philip Butler and Vicki Gavin of Redwing Environmental Ltd at Jaguar Cars Ltd, Browns Lane during June 2005.

All results pertain to the dates monitored only; these dates include the 8th to the 10th June 2005.

A summary of results is shown below:-

Emission point reference Stack N ^o	Total Particulate Matter range at reference conditions (mg/m ³)	30 minute VOC Concentrations at reference conditions (mg/m ³)	Isocyanate Concentrations at reference conditions (mg/m ³)	Velocity corrected to reference conditions (m/s)	Volume flow corrected to reference conditions (m ³ /hr)
VMC 3 Polyester Auto Cell 1	0.46 to 0.91	755.8 (752.8)	<0.007	8.0	8939
VMC 3 Polyester Auto Cell 2	<0.3 to 0.41	751.4 (581.0)	<0.007	8.5	9496
VMC 3 Polyester Auto Cell 3	0.34 to 1.07	34.0 (33.5)	<0.007	6.5	7260
VMC 3 Manual Spray 1	<0.26 to 0.34	4.9 (4.4)	<0.007	8.1	13212
VMC 3 Manual Spray 2	<0.3	9.2 (8.1)	<0.007	7.8	12752
VMC 3 PU Auto	0.3	11.7 (11.6)	<0.007	10.3	14223
VMC 1 UV Spray	0.6 to 0.9	22.4 (19.1)	<0.007	5.1	4921

The figures in blue are the average concentrations obtained for the duration of the run

1.0 INTRODUCTION

The monitoring of the seven exhausts were monitored with respect to quotation Q-RED05-039/EB/v0 for the compliance check monitoring of emissions to air. The substances requested for monitoring at each emission point are listed below:

Monitoring Programme

Substances to be monitored	Emission Point Identification						
	VMC 3 Auto Cell 1	VMC 3 Auto Cell 2	VMC 3 Auto Cell 3	VMC 3 Manual 1	VMC 3 Manual 2	VMC 3 PU Auto	VMC 1 UV Spray
Total Particulate Matter	✓	✓	✓	✓	✓	✓	✓
Volatile Organic Compounds	✓	✓	✓	✓	✓	✓	✓
Isocyanates	✓	✓	✓	✓	✓	✓	✓

Special requirements *Monitoring is only carried out during normal operations, no monitoring was carried out during scheduled or unscheduled breaks.*

- 1.1 The emission results will be compared to the results listed in the local authority permit.
- 1.2 The velocity and temperature profiles were within the required parameters of 9:1 (pascals) or 3:1 metres/second and $\pm 1\%$ for temperature profile. This information indicates that the sample ports are in ideal positions to collect the samples under representative conditions.

1.3 Monitoring Results

Emission Point Reference	Substance to be Monitored	Emission Limit Value	Periodic Monitoring Result	Units	Reference Conditions 273 K, 101.3 kPa	Date of Sampling	Start and End Times	Monitoring Method Reference	Accreditation for use of Method	Operating Status
VMC 3 Polyester Auto Cell 1	Total Particulate Matter	50	0.46 to 0.91	mg/m ³	273, 101.3kPa	09/06/05	0948-1020 1030-1102	ISO 9096	* UKAS accreditation applied for	Normal
	Volatile Organic Compounds	50	755.8	mg/m ³			1001-1101	BS EN 13526		
	Isocyanates	0.1	<0.007	mg/m ³			1000-1030	MDHS 25/3		
VMC 3 Polyester Auto Cell 2	Total Particulate Matter	50	<0.3 to 0.41	mg/m ³	273, 101.3kPa	08/06/05	1303-1335 1343-1415	ISO 9096	* UKAS accreditation applied for	Normal
	Volatile Organic Compounds	50	751.4	mg/m ³			1320-1420	BS EN 13526		
	Isocyanates	0.1	<0.007	mg/m ³			1330-1400	MDHS 25/3		
VMC 3 Polyester Auto Cell 3	Total Particulate Matter	50	0.34 to 1.07	mg/m ³	273, 101.3kPa	08/06/05	1428-1500 1508-1540	ISO 9096	* UKAS accreditation applied for	Normal
	Volatile Organic Compounds	50	34.0	mg/m ³			1431-1531	BS EN 13526		
	Isocyanates	0.1	<0.007	mg/m ³			1430-1500	MDHS 25/3		

Emission Point Reference	Substance to be Monitored	Emission Limit Value	Periodic Monitoring Result	Units	Reference Conditions 273 K, 101.3 kPa	Date of Sampling	Start and End Times	Monitoring Method Reference	Accreditation for use of Method	Operating Status
VMC 3 Manual Spray 1	Total Particulate Matter	50	<0.26 to 0.34	mg/m ³	273, 101.3kPa	09/06/05	1228-1300 1308-1340	ISO 9096	• UKAS accreditation applied for	Normal

* Redwing Environmental Ltd are in the process of applying for UKAS accreditation, all site staff are certified to MCerts levels 1 and 2

2 Supporting Information (Held by Redwing Environmental Ltd)

2.1 General Information

2.1.1 Redwing Environmental Ltd staff details

Philip Butler – MCerts Level 2 – TE1
Registration number MM 02 016

Vicki Gavin – MCerts Level 1
Registration number MM 02 018

2.2 Redwing Environmental Ltd method details

2.2.1 Test Methods

2.2.2 Particulate matter ISO 9096: 2003 (USEPA method 5 and method 17)

2.2.3 Total particulate matter was sampled using a CAE Method 5 isokinetic sampling system in accordance with USEPA method 5 - *Determination of particulate emissions from stationary sources* and USEPA method 17 - *Determination of particulate emissions from stationary sources (In-stack filtration method)*.

2.2.4 The CAE Method 5 sampling system monitors temperature, static pressure and velocities within the duct using an S-type pitot tube and K-type thermocouple. The sampling rate was continuously monitored and adjusted relative to the duct velocity to ensure isokinetic-sampling conditions were maintained throughout the monitoring period.

2.2.5 Exhaust gases were drawn under isokinetic conditions from the exhaust points using the Method 5 sampling probe, particulate matter was then collected on a pre-weighed glass fibre filter (or most suitable filter for process) contained within the filter cassette holder, and the total particulate matter determined gravimetrically.

2.2.6 It was also necessary to wash the probe and nozzle out with water and then acetone between sampling and the weight of the probe washing added to that collected on the sample filter. Analysis of an acetone/water blank was carried out and the result corrected accordingly.

2.2.7 The sample positions were calculated with respect to ISO9096:2003 – Stationary source emissions – Manual determination of mass concentration of particulate matter.

2.2.8 There were no deviations from the method; therefore the uncertainty for the monitoring procedure is reported to be:

Uncertainty: $\pm 30\%$

2.3 Stack Velocity, Pressure and Temperature Measurements

2.3.1 The stack velocity, pressure and temperature were measured by full pitot traverses of the duct using the points provided. Measurements were taken at ten equally spaced points along each proposed sampling line, excluding the 5% of the effective flue diameter from the wall.

2.4 Volatile organic compounds (BS EN 13526: 2001)

2.4.1 Monitoring to determine VOC emission concentrations was in accordance with BS EN 13526: 2001.

2.4.2 Volatile organic compound concentrations were measured using a Signal 3030PM portable heated VOC analyser. The analyser works by burning the gas sample in a hydrogen flame. This ionises any organic compounds present and the current produced across an electric field is proportional to the number of carbon atoms.

2.4.3 The analyser and heated line were zeroed and calibrated with a test gas (80 ppm and 800ppm propane) prior to each sampling run. VOC sampling was undertaken over a period of at least 60 minutes to cover any process variation.

2.4.4 All data was logged onto a Grant Squirrel data logger set at 5 second logging intervals.

2.4.5 A list of response factors are available so that specific concentrations can be calculated for known solvents within the sample exhaust.

2.4.6 A heated line from the sample point to analyser was used to ensure that condensation did not occur leading to the loss of sample concentration.

2.5 Leak tests for extractive techniques

2.5.1 All extractive-sampling techniques were tested for leaks before sampling proceeded. Any leaks present were eliminated prior to sampling and will be reported.

2.5.2 Leak checks are carried out during the calibration procedure, as the concentration of the calibration gas is known it is easily noticed if air is entering the sample line and diluting the gas.

2.6 Isocyanates (MDHS 25/3)

2.6.1 There are several Isocyanates; these include TDI, MDI, HDI and IPDI. The isocyanate monitored was TDI (Toluene diisocyanate). All Isocyanates follow the same procedure for sampling and analysis.

2.6.2 Isocyanates can be sampled non-isokinetically following MDHS 25 or isokinetically following the draft US EPA Method 207-1.

2.6.3 The method used was the non-isokinetic method. A sample probe was placed inside the stack; the sample probe was then attached to two midget impingers. The first impinger contained 10mls of 1,2 methoxy-phenyl piperazine and the second impinger was empty.

- 2.6.4 The impingers were then attached to a calibrated sample pump; the pump was left to run for approximately 30 minutes. The pump was then recalibrated and the total volume of the sample gas calculated. In the event of the solution evaporating, the sample volume is made up to 10mls using dry toluene.
- 2.6.5 The samples were then stored in brown glass bottles and submitted for analysis. The samples will then be 'blown down' to dryness using air and made up to 1ml using the most suitable matrix (usually acetonitrile). The sample will then be ready for analysis by HPLC (High Pressure Liquid Chromatography).

3.0 Quality Assurance

- 3.1 Redwing Environmental Ltd will always endeavour to follow the methods specified in the Environment Agency Technical Guidance M2. The methods followed will be listed as our Technical Procedures and will be put forward for UKAS accreditation.
- 3.2 Redwing Environmental Ltd are accredited to ISO 9001: 2000.

4.0 Disclaimer

- 4.1 Redwing Environmental Ltd confirm that in preparing this report all reasonable skill and care has been exercised.
- 4.1.1 Unless specifically assigned or transferred within the terms of the agreement, Redwing Environmental Ltd asserts and retains all copyright, and other Intellectual Property Rights, in and over the report and its contents.
