5. QUALITY CONTROL

APPENDIX 1 Data Logs and Calculations

APPENDIX 2 Analysis Reports

APPENDIX 3 Details of Plant Operation During Testing

1. INTRODUCTION

The four cremators and associated flue gas treatment systems at Canley Garden Crematorium were monitored between the 27th and 28th March 2012 to the requirements given in Process Guidance Note PG5/2 (2004) for emission releases to atmosphere for abated plant.

The work involved monitoring a range of flue gas components with the plant operating normally.

The plant comprises Nos.1, 2 & 3 Cremators that are designated as the model FTII, and No.4 Cremator that is the model type FTIII. The two cremator types are similar other than the FTIII having a wider hearth capable of accepting larger coffin sizes. Each cremator is fitted with two nozzle mix burners utilising natural gas as the support fuel.

Cremators 1 & 2 share a combined flue gas treatment system designated as Stream 1, with an identical arrangement for Cremators 3 & 4 designated as Stream 2.

The waste gases from the two cremators combine, and are ducted to a common flue gas treatment plant. The treatment plant comprises a shell and tube boiler to cool the flue gases, a reagent feeder station that introduces a blend of activated carbon/sodium bicarbonate to react with the cooled gases, and a bag filter to clean the treated gases. The waste heat from the boiler in the form of warm water is dissipated to atmosphere via a finned tube air blast cooler situated outside the crematory.

The plant operates under full microprocessor based automatic control that requires little manual intervention.

The cremators and flue gas clean up system were manufactured, installed and commissioned by Facultatieve Technologies Limited to meet the requirements of the Environmental Permitting (England and Wales) Regulations 2007 – (EPR 2007) as relevant to cremators, summarised in the Secretary of State's Process Guidance Note PG 5/2 (2004).

The flue ducting and test points were in accordance with the requirements of EA TGN M1.

Measurements were undertaken to enable comparisons to be made of the operation of the cremators and associated flue gas treatment system with the requirements of the Guidance Note in terms of emission releases to air.

This report details the monitoring procedures used and the results obtained from this test work along with comparisons with the Guidance Note requirements and comments where appropriate.

Relevant procedures were followed to enable quality control to be maintained throughout the test preparation, site test work, laboratory analysis, calculations and reporting.

2. PROCEDURES

2.1 Total Particulate Matter

A flue gas sample was extracted and filtered to collect total particulate matter. A Whatman QM-A filter paper was used with a particle retention of not less than 99.5% at a particle size of 0.3 micron. The flue gas extraction employed techniques given in BS EN 13284 Part 1, and the adaptations given in PG Note 5/2 (2004) Clause 9.5, allowing sampling in one line of the flue duct due to the batch nature of the cremation process.

The method employed was BS EN 13284 Part 1 and the PG Note 5/2 (2004) Clause 9.5 adaptations.

The sampling was conducted using apparatus in accordance with the requirements of BS EN 13284 Part 1.

This consisted of a heated known dimension Pyrex glass nozzle, heated Pyrex glass probe liner, heated Pyrex glass filter housing with Titanium filter support containing quartz microfibre filter (all heaters set to 160°C), PTFE sample line, dreschel absorption bottles, gas dryer (silica gel), sample line to pump, pump, gas meter, rotameter, pitot and impulse lines, electronic manometer, type K thermocouple, balance (for gravimetric moisture) and datalogger. Settings tables were pre-prepared to enable isokinetic flow to be maintained (based on online measurements of flue gas velocity and temperature to set nozzle flow / pump rate (l/min)).

Particulate matter analysis was carried out by weighing the filter and probe rinse collection on a calibrated balance, with the media being dried and weighed prior to and following the test.

Standard BS EN 13284 Part 1 was deviated from only in so far as a consequence of conducting tests in accordance with the recommendations given in the Appendices of PG5/2(04) that state that only one sampling line be used for each test run. This is contrary to the BS EN 13284 Part 1 that requires both sample lines to be used during an isokinetic test i.e. four point sampling (2 points x 2 lines) for a duct of this diameter.

The effect on uncertainty of using only one sample line is not considered to be significant and is within the calculated uncertainties stated in the report. These assumptions are on the basis that the preliminary pitot traverses confirmed the gas velocity profiles are well within required limits, and the duct diameter was small. There is no reason to suspect that the gas sampled from only one sampling plane is not representative of the duct as a whole.

The recommended deviations to procedures set down in PG 5/2 (04) Clause 9.5 and PG 5/2 (95) Clause 2.2 are a reflection that cremation is a batch process, and that changing sampling ports part-way through a cremation could introduce more errors due to the fact that a period of each cremation would not be sampled during the changeover process.

The tests reported herein were conducted to prove the performance of the cremators relative to PG5/2(04).

2.2 Hydrogen Chloride

A flue gas sample was extracted and filtered. The gas sample was then passed through an absorption medium of de-ionised water to collect hydrogen chloride.

The method employed was BS EN 1911 Parts 1-3.

Laboratory analysis for hydrogen chloride was carried out on the absorption medium using Ion Chromatography (IC).

2.3 Mercury

A flue gas sample was extracted and filtered to collect solid phase mercury.

A Whatman QM-A filter paper was used with a particle retention of not less than 99.5% at a particle size of 0.3 micron. The flue gas extraction employed techniques given in BS EN 13284 Part 1, and the adaptations given in PG Note 5/2 (2004) Clause 9.5, allowing sampling in one line of the flue duct due to the batch nature of the cremation process. The reasons for following the PG 5/2 adaptations are given above in Clause 2.1.

The gas sample was then passed through an absorption medium of acidified potassium dichromate to collect vapour phase mercury.

The method employed was BS EN 13211.

Laboratory analysis for solid and vapour phase mercury was carried out on the filter and absorption medium using cold vapour atomic fluorescence spectroscopy (CVAFS).

2.4 Carbon Monoxide

A flue gas sample was continuously extracted, filtered and dried before being passed through a pre-calibrated Siemens Ultramat 21/O₂ infrared analyser for the on-line measurement of carbon monoxide. The analyser has a fixed range of 0-1250 mg/Nm³ and was zeroed with air and calibrated with a nominal 800 ppmv carbon monoxide in balance nitrogen gas.

The method employed was BS ISO 12039.

The analyser output was continuously recorded using a Grant 'Squirrel' data logger.

For these tests a relatively high range analyser was used due to the typical pattern of carbon monoxide concentration emissions from cremators being very low (often indicated as zero) for most of the cycle, but with occasional, high, short duration spikes of CO being emitted. The convention since non-continuous emissions monitoring became a mandatory requirement for cremators during 1990, has been to attempt to monitor the magnitude of spikes, as these are often the main contributor to total CO emissions. If the mean one minute emission of CO was say 200 mg/Nm³, it would be expected that the peak concentration during that one minute averaging period would be considerably higher than this. It

follows that utilising a lower range analyser would frequently understate CO emissions, despite increasing sensitivity at low CO concentrations.

2.5 Volatile Organic Compounds

A flue gas sample was continuously extracted and filtered before being passed via a heated line through a pre-calibrated Signal 3030PM Flame Ionisation Detection (FID) analyser for the on-line measurement of volatile organic compounds. The analyser was ranged 0-100 ppmv total hydrocarbons and was zeroed with air passed through a catalytic converter and calibrated with a nominal 50 ppmv propane in balance air gas.

The method employed was BS EN 12619.

The analyser output was continuously recorded using a Grant 'Squirrel' data logger.

Similar comments apply to VOC's as CO, in that the analyser scaling is set to quantify the peaks that are the nature of the emission.

2.6 Oxygen

A flue gas sample was continuously extracted from the same position in the flue as the other pollutants extraction, filtered and dried before being passed through a pre-calibrated Siemens Ultramat 21/O₂ electrochemical cell analyser for the on-line measurement of flue oxygen.

An analogue output was taken from the plants own oxygen analyser for monitoring the oxygen content at the outlet of the secondary combustion chamber. This instrument measures the oxygen wet, and the readings were corrected to a dry basis for use in the secondary combustion chamber gas residence time calculations.

The method employed was BS ISO 12039.

The analysers were calibrated using a standard reference gas in the laboratory before and after the site visit, and with nitrogen "zero" gas and air at the start and end of each day's testing on site. It was assumed that calibration linearity was maintained during sampling, and the post checks indicated that this was the case.

The outputs of the analysers were continuously recorded using a Grant 'Squirrel' data logger.

2.7 Moisture

A flue gas sample was extracted and filtered. The gas sample was then passed through an absorption medium to collect any water vapour.

The method employed was BS EN 14790.

Flue gas moisture was determined gravimetrically by weighing the absorption medium and final gas drier prior to and following the test.

This was carried out alongside testing for hydrogen chloride and mercury.

2.8 Temperature

The cremator secondary chamber exit and flue (filter outlet) temperatures were measured by the use of calibrated Type K thermocouples.

The method employed was BS EN 13284 Part 1.

The gas temperatures were continuously recorded using a Grant 'Squirrel' data logger.

2.9 Velocity and Volumetric Flow

Flue gas velocity was found from inserting a calibrated s-type pitot tube into the flue. The pitot head pressure was then measured using a calibrated electronic manometer.

The method employed was BS EN 13284 Part 1.

The electronic manometer output was continuously recorded using a Grant 'Squirrel' data logger.

Flue gas velocity was then calculated from Bernoulli's equation as the density of the flue gas was known (from measurements of flue gas moisture and temperature).

Flue gas volumetric flow rate was found from the measurement of the flue duct size and hence its area and corrected to normalised conditions (again from measurements of flue gas moisture and temperature).

3. RESULTS

The results are summarised in Tables 1 to 4.

Total Particulate Matter, Hydrogen Chloride, Carbon Monoxide and Volatile Organic Compound determinations for Streams 1 & 2 are given in Tables 1 & 2.

Mercury determinations for Streams 1 & 2 are given in Tables 3 & 4.

Moisture determinations were made on all tests.

Carbon Monoxide, Volatile Organic Compounds, Oxygen, Temperature and Velocity and Volumetric Flow were continuously monitored.

All values in the tables are corrected to the reference conditions of 273K, 101.3kPa, 11%v/v oxygen and dry gas as given in PG5/2(04) where required.

All the data logs and calculations can be seen in Appendix 1.

All the analysis reports can be seen in Appendix 2.

Details of plant operation during testing are given in Appendix 3.

Note 2: All uncertainties (\pm) are calculated to a 95% confidence interval

Uncertainties estimated using the procedure suggested in the STA Quality Guidance Note QGN001-01

4. COMMENTS

The results from these series of tests demonstrate that the average emissions from both plant streams satisfy the requirements of PG5/2(2004) for the releases to air of particulate matter, hydrogen chloride, mercury, carbon monoxide and volatile organic compounds.

The HCl emission from Test 2 for Stream 1 was above the emission limit value, but the average from the three tests was compliant.

No visible chimney emissions were observed throughout the test period other than the expected steam plume during preheat.

5. QUALITY CONTROL

All the tests performed were carried out to the methods given in the appropriate listed Standards using calibrated equipment. The gas analysers were calibrated prior to use using suitable calibration gases.

Analysis of the filters and absorbers was carried out in-house and at an external laboratory.

For this test work the following external laboratory was used for the given determinations:

Scientific Analysis Laboratories (SAL)	}	Hydrogen Chloride
		Mercury

APPENDIX 1

Data Logs and Calculations

Explanation of Data Logs

Data is taken from a Grant Squirrel data logger.

Time is from logger clock.

Flue Gas Temp is direct from test flue thermocouple.

Meter Temp is direct from gas meter.

(The stated meter temperature is that of the sampled gas at the meter, and is not the room ambient temperature. The temperature always increases during a test due to the heat gain from the sample pump that is contained in an enclosed box along with the gas meter, and this is quite normal).

Flue O₂ is from the Siemens Ultramat U21/O₂ analyser.

CO is from the Siemens Ultramat U21/O₂ analyser.

VOC is from the Signal 3030PM FID analyser expressed as carbon equivalent.

Sample Point Pa is from the pitot tube to an Furness Controls electronic manometer.

Duct Mean Pa is Sample Point Pa corrected for average position from traverse logs included.

The room temperature was typically 20°C, and there were no issues with the analysers overheating. Functional and calibration checks at the start and end of each test confirmed correct operation of the analysers.

All values in the tables are corrected to the reference conditions of 273K, 101.3kPa, 11%v/v oxygen and dry gas as given in PG5/2(04) where required.

Flue Gas Volumetric Flow

Contract Canley Garden Crematorium, DEM0562
Date 27 - 28th March 2012
Location Flue Gas Abatement System Outlet
Engineer(s) JB & ST

Test Log	Test 4	Test 5	Test 6
Flue Gas Temperature(Deg C)	93	96	94
Flue Gas Pitot Head Sample Points(Pa)	100.4	189.0	126.4
Flue Gas Pitot Head Duct Mean(Pa)	99.9	186.2	127.3
Flue Gas Moisture(%v/v)	6.8	6.4	8.7
Flue Gas Moisture(%w/w)	4.3	4.1	5.6
Flue Gas Duct Dimensions(mm)	350 mm Diameter Circular Stack		
Flue Gas Duct Area(m ²)	0.0962		

Calculation

Flue Gas Density(kg/m ³)	0.9486	0.9423	0.9402
<u>Sample Points</u>			
Flue Gas Velocity(Am/s)	14.55	20.03	16.40
Flue Gas Volumetric Flowrate(Am ³ /h)	5039	6938	5680
Flue Gas Volumetric Flowrate(Am ³ /h dry)	4696	6495	5185
Flue Gas Volumetric Flowrate(Nm ³ /h dry)	3504	4808	3852
<u>Duct Mean</u>			
Flue Gas Velocity(Am/s)	14.51	19.88	16.45
Flue Gas Volumetric Flowrate(Am ³ /h)	5027	6886	5699
Flue Gas Volumetric Flowrate(Am ³ /h dry)	4685	6446	5202
Flue Gas Volumetric Flowrate(Nm ³ /h dry)	3495	4772	3865

APPENDIX 2

Analysis Reports

Scientific Analysis Laboratories is a limited company registered in England and Wales (No 2514788) whose address is at Hadfield House, Hadfield Street, Manchester M16 9FE

Scientific Analysis Laboratories Ltd

Certificate of Analysis

Hadfield House
Hadfield Street
Combrook
Manchester
M16 9FE
Tel : 0161 874 2400
Fax : 0161 874 2404

Report Number: 274362-1

Date of Report: 25-Apr-2012

Customer: Davies & Co (Engineering)
PO Box 11
Leeds
LS10 2XS

Customer Contact: Mr Steve Atherton

Customer Job Reference: DEM0562

Customer Purchase Order: 50000605

Date Job Received at SAL: 10-Apr-2012

Date Analysis Started: 11-Apr-2012

Date Analysis Completed: 25-Apr-2012

The results reported relate to samples received in the laboratory
Opinions and interpretations expressed herein are outside the scope of UKAS accreditation
This report should not be reproduced except in full without the written approval of the laboratory
Tests covered by this certificate were conducted in accordance with SAL SOPs

Report checked
